Today's Cards — How to Use It

1. What it is

- Detailed race card for each race showing form, ratings, and context in one view
- Combines runners with historical strike rates, going suitability, and live exchange prices
- Provides supporting evidence behind each runner, complementing the Tissue Pricer's model price
- Helps understand why a runner rates as it does before or alongside checking the tissue

2. The race header

- Course and time
- Surface and distance
- Class
- Going badge (e.g. Good To Firm) — official going for the race

3. The Strong / Neutral / Weak legend

- Three colour swatches indicating signal strength across the table
- Green = strong signal
- Amber = neutral signal
- Red = weak signal
- Colour intensity reflects strength of the signal, not just direction

4. Reading the card — column by column

Columns

- # — saddlecloth / runner number
- HORSE — name with strike rate and runs in brackets (e.g. 25% from 4)
- AGE — age of the runner
- SEX — e.g. F (filly), G (gelding), C (colt)
- WT — weight carried
- OR — official rating
- RATING — star rating on a 5-star visual scale
- JOCKEY — name with jockey strike rate % and total rides in brackets
- TRAINER — name with trainer strike rate % and total runs in brackets
- GOING — going-suitability score (e.g. +33, -55), colour-coded

Going score details

- Positive score = suited by today's going
- Negative score = unsuited
- Asterisk (*) = estimated from adjacent conditions, not exact
- EXCH — current exchange price plus live price-movement sparkline indicating drifting or shortening

5. Reading strike rates correctly

- SR% = historical strike rate, not a win probability for today
- Bracketed number is sample size; smaller samples less reliable
- High % from tiny samples should be treated with caution
- Jockey and trainer strike rates provide context, not predictions

6. The form line (beneath each runner)

- Plain-English summary including wins/starts, course record, class moves, trip changes
- Flags such as "First-time h1" (headgear), "Steps up in class", "Up 1f in trip"
- Warning like "Unproven on today's going" is important context

7. Reading the going score

- Built from horse's historical going records
- Asterisk indicates estimate from adjacent going, treat as indicative not certain
- Strong positive score plus suited conditions strengthens runner's case
- Heavy negative score (e.g. -55) is significant, especially on firm or soft ground extremes

8. Reading the EXCH price movement

- Sparkline shows how price has moved over time, not just current price
- Shortening price indicates market support
- Drifting price signals market weakening
- Price updates are not live to the second; check timestamp
- Use alongside Tissue Pricer to spot market movement toward or away from value

9. Putting it into action

- Use Today's Cards to understand context behind runner ratings
- Cross-reference with Tissue Pricer's edge for that horse
- Weight strike rates by sample size and going scores considering asterisk caveat
- Size bets sensibly; use Bet Calculator if needed

10. Common mistakes to avoid

- Interpreting horse SR% as today's win chance instead of historical strike rate
- Trusting high strike rate from very small samples
- Ignoring warnings like "unproven on going" or heavy negative going scores
- Reading current prices without checking direction of price movement

11. Where to go next

- Cross-check with Tissue Pricer for model price and edge
- Use Going Bias / Draw Bias tools for deeper conditions analysis
- Read the framework behind all: Mispriced
